

Applications

It is the particular advantage of mathematics, that structures can be transferred from one field to the other quickly revealing new insights and results. For example, CiT's Predici – intended and mainly used for the modelling and simulation of polymer reaction kinetics – has also been applied to car catalysts, bio filters, chemical master equations, pharmacokinetics and much more. It is our commitment to produce tools transcending the knowledge of the times of development. Tools that stand requirements people couldn't even imagine before. Nevertheless, there are core applications related to core packages. So please check out our recommendations following the respective links. For all applications we can provide exemplary documents and publications. Please contact us for obtaining more information.
